Insecta Mundi is a journal primarily devoted to insect systematics, but articles can be published on any non-marine arthropod taxon. Manuscripts considered for publication include, but are not limited to, systematic or taxonomic studies, revisions, nomenclatural changes, faunal studies, book reviews, phylogenetic analyses, biological or behavioral studies, etc. Insecta Mundi is widely distributed, and referenced or abstracted by several sources including the Zoological Record, CAB Abstracts, etc.

As of 2007, Insecta Mundi is published irregularly throughout the year, not as quarterly issues. As manuscripts are completed they are published and given an individual number. Manuscripts must be peer reviewed prior to submission, after which they are again reviewed by the editorial board to insure quality. One author of each submitted manuscript must be a current member of the Center for Systematic Entomology.

**Abstract.** The previously unknown male of *Plectromerus michelii* Nearns and Branham is described and illustrated.

**Introduction**

*Plectromerus michelii* Nearns and Branham, 2008 (Cerambycinae: Plectomerini) was described from two female specimens collected in the Cayman Islands. Thomas et al. (2008) provided a color habitus photograph of the holotype deposited in the Florida State Collection of Arthropods (FSCA), Gainesville, FL. Three additional specimens collected by E.J. Gerberg (Gainesville, FL) and deposited in the FSCA were recently made available; the first known male specimen and two additional females. The collection data for these specimens are: Cayman Islands, Grand Cayman, Boatswain Point, Lime Tree Estate, on 16-XII-1977, 7-X-1980, and 27-II-1987. The following description supplements the description of this species using the methods indicated in Nearns and Branham (2008).

**Description.** Male. Length 5.5 mm, width 1.1 mm (measured across humeri). Habitus as in Fig. 1a. Similar to female except pronotal sides with coarse punctures and prosternum with one irregular patch of coarse, deep punctures in front of each procoxa (Fig. 1b). Metafemoral teeth with posterior edge weakly, shallowly serrate, with about 12 irregular serration “peaks”; each peak with a short, curved, pale hair; metatibiae slightly sinuate, about 0.7 times as long as metafemora (Fig. 1c). Abdomen with terminal sternite broadly rounded, slightly longer than preceding sternite.

**Acknowledgments**

I thank Mike Thomas (FSCA, Gainesville, FL) for the loan of specimens. I also thank Kelly Miller (University of New Mexico, Albuquerque, NM), Traci Grzymala (University of New Mexico, Albuquerque, NM), and Ian Swift (Placerita Canyon Natural Area, Newhall, CA) for critical suggestions to improve an earlier version of this manuscript.
